

With an increasing population communicating via the internet and text messaging, face-to-face communication will become a thing of the past. To what extent do you agree?

Give reasons for your answer and include any relevant examples from your knowledge or experience.

You should write at least 250 words.

With an increasing population communicating via the internet-Band 8 IELTS model essay

Private and strong bonds between people could fall significantly in the next few years due to technology advancements. However, I believe that personal interaction, which is the primary source of happy feelings and human well-being, will never be completely replaced by the Internet.

In the first place, technological improvements have drastically affected the method in which individuals communicate. The internet allows the public to communicate with people in faraway nations. People utilize numerous video call apps to speak with their loved ones because this mode of communication is more convenient, cost-free, and globally accessible. Text messages are currently more popular than face-to-face interactions since they allow for the quickest exchange of ideas and emotions. Text allows users to transmit photographs and documents in addition to text messages, making it the most convenient means of communication.

The worldwide network, on the other hand, allows a wide range of employees who previously had to travel to the office for work meetings to spend more time at home. Consequently, they have a more flexible work schedule because staff can join the call online from their own homes. When it comes to family and child care, this time can be used to improve people's quality of personal communication, but not their quantity. There's little doubt that the amount of time spent on intimate relationships is going to increase over the next few decades as a result of this advantage.

In conclusion, I agree that social media severely impacts people's face-to-face ties who are unwell with weak willpower and poor time management skills, while others will use the Internet to benefit their schedule and social circle.

With an increasing population communicating via the internet-Band 7.5 IELTS model essay

Communication has always been a vital facet of life, with potential effects on mental and physical health, for example. In spite of this, there is a contention that by increasing the use of current technology, face-to-face communication would be supplanted by means such as video calls, which I fully reject.

Using technology and the internet to communicate with loved ones, such as friends and family, may not be the greatest strategy and may not be as productive or pleasurable as spending time with them in person. In other words, it is merely a suggestion to stay in contact with them during unique circumstances, such as the COVID-19 migration. Social media interaction is limited; you cannot touch or embrace the other person, for e.g., which makes it incompatible with face-to-face dialogue.

In contrast, the Internet expanded personal leisure time for a variety of employees who had to commute to the office for business meetings in the previous century. When employees can join a conference call online from home, they have a significantly more flexible work schedule. Consequently, this time can be spent on family connections and child care, which greatly improves the quality, but not the amount, of private conversation among individuals. As a result, for various reasons, it is projected that the number of offline discussions will fall dramatically over the next few decades. but the amount of time spent on personal communication will increase.

Despite the fact that contemporary technology has altered people's lifestyles, including their interaction preferences, the majority still prefer face-to-face communication. This is, in my opinion, the style that will never change, despite the Internet's prominence.

With an increasing population communicating via the internet-Band 7 IELTS model essay

The use of online communication is becoming more widespread. However, this essay disagrees with the notion that it would invalidate the primary purpose of face-to-face interaction between individuals, which we will explain here.

Firstly, it is undeniable that the present age prefers to communicate via the internet rather than meet face-to-face. When it comes to keeping in touch with friends from all around the world, social media is the most convenient method of communication. Young people are increasingly turning to the Internet to fill their downtime by conversing with strangers and browsing social media. That may create a false sense of purpose and fulfillment, and it may diminish the desire for face-to-face relationships and emotional bonds.

Secondly, when people use language to interact with each other, they need to incorporate emotional qualities. As far as we're concerned, it's critical that they have as little miscommunication as possible. In online chat conversations, it's hard to tell what the other person is thinking or feeling because people can't distinguish between loud and low-tones, statements and questions, furious and joyous expressions, etc., while they're utilizing online messaging to communicate. Punctuation or conjunctions are two examples of grammatical rules that are frequently broken. Because of this, there is a risk of miscommunication and even conflict between them. As e.g., people who publish status updates on social media sites like Facebook and Twitter are sometimes misunderstood by others, especially if they make grammatical errors.

Finally, I believe that, as technology advances, face-to-face contact will become increasingly obsolete. Face-to-face communication is critical, not just for conveying information but also for maintaining ties with others outside one's immediate environment.

With an increasing population communicating via the internet-Band 6.5 IELTS model essay

Since the 1990s, how we communicate has changed dramatically. The Internet and texting are modern, simple, and efficient communication methods. Face-to-face communication is the best way to strengthen relationships, values, and bonds. So, I believe that face to face communication brings much more benefits than internet or text messaging.

Technological advances have encouraged the current generation to favor online contacts over in-person meetings. Social networking is the most convenient way to communicate with global pals. Young people waste time on the Internet by chatting with strangers and reading social media sites. This can produce a false sense of purpose and fulfillment, reducing the desire for face-to-face discussion and close relationships. It gives the illusion of closeness among people, which is not actually true, instead it diminishes.

Face-to-face interaction will return to fashion, regardless of how far communication technology advances. Online intelligence can't supply ties, contact, feelings, celebrations, living, and enjoying the moment. These emotions are vital to being human. People have thousands of Facebook friends, and millions of Instagram followers, yet they're useless when they're miserable. Interpersonal communication won't die out. As we are social beings, it is important to connect with others. Physical presence is needed to create a bond and relationships. Without creating bond with others, our quality of life will be poor.

In conclusion, the internet and text messaging have made things possible that were not feasible before. But they can never replace the necessity of a direct connection with an individual because emotion is tied to it.
