

Global environmental issues are the responsibility of richer nations, not poorer ones. To what extent do you agree or disagree?

Include any relevant examples from your own experiences or expertise and your reasoning for your choice.

*Write at least **250** words.*

Global environmental issues are the responsibility of rich nations - Band 8 IELTS model essay

Global warming is causing a number of problems for the ecosystem that are becoming worse every day. However, it is not plausible to blame industrialized nations for this on their own, and I do not believe this to be the case. So, I'll talk about what's triggering this issue and how to fix it.

Several actions are possible for governments in both poor and prosperous countries. To begin, developed nations have the resources to invest in innovative technologies that will eventually render gasoline-powered vehicles obsolete. Since environmentally friendly automobiles already exist, all that needs to be done is to lower the price of electric cars so that more people can afford to drive them. To achieve this goal, governments and businesses might provide financial incentives for the development and production of electric vehicles, such as lowering the tax burden on buyers of such vehicles.

In contrast, environmental damage is expanding over the globe due to the presence of different pollutants. To begin with, air and noise pollution are growing at an alarming rate due to the enormous number of traffic on the roads. To explain, the pollutants produced by these fuel-burning automobiles are not only hazardous to the environment but also contribute to urban noise pollution. Second, greenhouse gas emissions from industry cannot be ignored since both developed and developing nations construct factories to grow exports and strengthen their economies.

In conclusion, poor nations may teach their citizens about the significance of the environment, despite the fact that affluent governments have more professional procedures and people with the expertise to create the world's most environmentally friendly form of transportation.

Global environmental issues are the responsibility of rich nations - Band 7.5 IELTS model essay

Due to their major influence on human progress, environmental issues have attracted a great deal of media attention in recent decades. Even if it makes sense to say that wealthier nations

should shoulder some of the burdens for these problems on behalf of the global community, I think every country should be held accountable.

There are a number of arguments in favor of the developed world taking on environmental responsibilities. First, compared to developing countries, wealthier nations have a larger number of internationally known scientists and environmental specialists. This suggests that working together might help them find a cleaner energy source to replace fossil fuel, the leading cause of greenhouse gas emissions. In addition, many capital investment activities in projects developing cutting-edge green technology may be reliably linked to the robust financial muscle of industrialized countries.

Environmental problems are strongly encouraged in several rising nations. First, third-world nations are building industrial parks with many factories quicker than wealthier ones, which may increase exhaust pollution. Local governments should reduce carbon and methane emissions to help the environment. Second, environmental ignorance in developing nations may lead to deforestation and overexploitation. Thus, local governments must build more schools to educate people about the dangers of environmental hazards. People would care more about the environment and safeguard it.

In conclusion, industrialized nations and developing countries have equal responsibilities for addressing global environmental concerns. It is imperative that both the governing bodies and the general populace of the world work together to find solutions to these issues.

Global environmental issues are the responsibility of rich nations - Band 7 IELTS model essay

Issues related to the environment have gained a lot of attention in the media in recent decades because of the impact they have on human progress. It's clear that the international community looks to the developed nations to handle these issues, but I think every country should do its part.

Environmental degradation is accelerating in many countries as a result of a variety of pollution sources. To begin with, traffic congestion is a significant contributor to the concerning increase in air and noise pollution. To be more specific, the exhaust from these internal combustion engine automobiles is both an environmental danger and a source of urban noise. Because both countries are building factories to enhance exports and economies, greenhouse gas emissions from industry cannot be overlooked.

Environmental concerns are important for developed nations. First, wealthy nations have more famous scientists and environmentalists than impoverished nations. Thus, replacing fossil fuel the biggest carbon emitter with a greener energy source is vital. Advanced green technology projects impact developed nations' finances. For different reasons, rising nations are aggressively urged to handle some environmental challenges themselves. Industrial parks may pollute the air. Local governments should reduce carbon and methane emissions to help the

environment. Environmental illiteracy in emerging nations can cause deforestation and overexploitation. Local governments should open more schools to educate people about environmental concerns' detrimental impacts.

Not to put too fine a point on it, but nations that have commercialized as well as nations that are still developing are equally to fault for the state of the global ecosystem. All across the world, individuals and government authorities should work together to find solutions to these problems.

Global environmental issues are the responsibility of rich nations - Band 6.5 IELTS model essay

The degradation of the environment has been a topic that has received a lot of attention in recent years. Some people are of the opinion that the responsibility for protecting the environment should exclusively fall on countries with large amounts of wealth. I do not agree with this point of view, and in the paragraphs that follow, I will emphasize my views supporting my opinion.

To begin, developed countries should take on the responsibility since they have the resources to do so. For instance, wealthier nations have access to a wide range of specialists and researchers who are capable of devising some workable solutions to the problem of environmental degradation. In addition to this, affluent nations have access to far bigger financial resources than underdeveloped nations have. Because of this, they are in a better position to make investments in businesses that concentrate on energy-generating and recycling sectors.

However, despite their lack of resources, emerging countries are a major contributor to environmental problems on a global scale. The economies in these regions want to expand, but they don't want to throw any more money at the region's mounting environmental issues. In addition, industrialization is rapidly expanding throughout the world's developing nations, which results in the emission of significant amounts of greenhouse gases into the atmosphere and poses a danger to the natural ecosystems that are still present on the planet.

In conclusion, I disagree with the notion that only wealthier nations should be responsible for addressing environmental challenges. Despite their well-developed and ample resources, all nations contribute to the occurrence of environmental catastrophes.
