

One of the consequences of improved medical care is that people are living longer and life expectancy is increasing. Do you think advantages outweigh disadvantages? (H2)

Include any relevant examples from your own experiences or expertise, as well as your reasoning for your choice.

*Write at least **250** words.*

One of the consequences of improved medical care - Band 8 IELTS model essay (H2)

The field of medicine is always evolving and becoming more advanced. Longevity and an increase in the average lifetime are two results that may be attributed to such advancements; personally, I believe that the benefits significantly exceed the downsides.

The passing of a loved one is a terrible experience, and the grief that follows may sometimes feel overwhelming and insurmountable. As a direct consequence of this, it is challenging to stick to the same routine during these challenging seasons. These days, the prevalence of this ailment is lower than it used to be, which means that people no longer need to live in constant worry of losing a loved one to the disease. One additional benefit of this advancement in medical technology is that we will have more time to spend with the people we care about. Through conversation with them, we could get insight into their lives and the wider world around us.

In contrast, there are major downsides to living longer. Providing financial aid to seniors is one of them. Whether they choose to age in place at a nursing home or remain independent, all seniors will incur greater financial burdens from the government and their communities as they require higher levels of specialized care as they become older. Another consequence is a shrinking and older workforce. Some retirees may be allowed to continue working because of the age rise, but they may be unable to perform their duties as well as they formerly did. For example, even though a senior has years of expertise in the workforce, keeping up with the latest software and hardware might be challenging.

The final benefit of these advancements in medical technology is an increase in the average lifespan. This trend, in my opinion, provides possibilities to benefit from the knowledge and wisdom of our forebears as well as to spend more quality time with them.

One of the consequences of improved medical care - Band 7.5 IELTS model essay

There is no doubt that the development of new technologies has been an essential contributor to the progression of medical care. As a direct consequence of this development, the average lifespan of individuals has grown over the course of history. This article explores both the positive and negative aspects of human beings being able to live longer as a direct result of developments in medical technology.

One of the best things about having a longer expected life span is that people will have more time on their hands, giving them the chance to do more things and learn more about life. Many young people in today's society put too much emphasis on making personal and professional progress at the expense of their desire to have fun. People are more likely to live longer if they have the freedom to start working on their goals as soon as possible. With the help of new strategies that have been made possible by spending money on medical care over the years, the vast majority of people with chronic and untreatable diseases like cancer can now be helped.

There are, however, certain disadvantages to people living longer. The fundamental issue is the growing population of elderly persons who need assistance. In truth, many industrialized nations prioritize providing higher pensions for the elderly and spending a lot of money building and improving their healthcare systems rather than investing money on other things like education and agriculture.

In conclusion, I believe that the advantages of the growing medical business outweigh the disadvantages, since a greater number of people are able to follow their interests, and more effective therapies for a wider variety of ailments are discovered.

One of the consequences of improved medical care - Band 7 IELTS model essay

Scientists' diligence and expertise in recent years have led to the development of treatments for a number of potentially fatal illnesses, greatly benefiting human health. Because of this, people nowadays tend to live longer than their ancestors did. There are benefits and drawbacks to this happening, but I believe the benefits will outweigh the drawbacks.

To begin, this new trend comes with a slew of problems. To start, a proportionately older population is a direct result of the trend toward longer life expectancy. Because the old are unable to provide for themselves financially, the authorities must shoulder the cost of caring for them. Consequently, an abundance of senior citizens will have a dampening effect on the local economy. Second, there's cause for concern over a relative scarcity of available human resources. To elaborate, in industries like manufacturing products, which require a large group

of workers, the resources of youthful staff will become inadequate as people live longer and older.

On the other hand, I believe that having a longer life expectancy is beneficial in a variety of ways. These elderly people may work with vitality and vigor in their occupations. Because of their elderly age, they may still contribute to society. The elderly are also beneficial to the country since they will pass on traditional beliefs to the new generation, assisting the latter in acquiring a better grasp of the past. People will also have more time for their lives and families if they live longer.

In conclusion, despite the fact that increased longevity may give rise to certain potential negatives, I feel that its benefits would exceed its cons because advancements in scientific knowledge most likely enhance the quality of human existence.

One of the consequences of improved medical care - Band 6.5 IELTS model essay

The progressive advancement of science and technology over the past 50 years has led to the discovery of new pharmaceuticals and medical treatments. As a result, people today can live longer than their ancestors. Despite the potential burden that this development may impose on medical practitioners, I believe that society as a whole stands to benefit greatly from it.

One bad thing about people living longer is that doctors and nurses may have to do more work. In other words, people who are older are more likely to get sick. So, society needs more doctors and nurses to take care of its growing number of older people. A really big problem is caused by the fact that there aren't enough doctors, nurses, and hospital beds. Also, as people get older, the government needs to give out more benefits. This is so that when there are more old people in society, the government can help them enough without having to raise taxes on people who are working age.

Still, with an increased lifespan comes the reality that some sixty-somethings are in fine shape. Effortlessly, they get the job done. Professionals in retirement would be a tremendous asset to companies if they were permitted to return to the workforce due to their vast amounts of relevant job experience and superior expertise in their fields. Grandparents may be able to help their grandchildren deal with adversity since they have more life experience than young people. Finally, in certain families, young parents with demanding schedules may entrust their children's care and education in the areas of morals, etiquette, and knowledge to more seasoned family members.

In conclusion, it is true that increasing life expectancy may have an impact on medical services and facilities, but it also has several benefits.
