

Research indicates that the characteristics we are born with have much more influence on our personality and development than any experiences we may have in our life. Which do you consider to be the major influence?

Give reasons for your answer and include any relevant examples from your own knowledge or experience.

You should write at least 250 words.

Research indicates that the characteristics we are born - Band 8 IELTS model essay

According to the analysis of various aspects of research, our personalities and the ways in which we develop are primarily shaped by the characteristics we possess at birth, rather than by the experiences we have in our lifetimes. I do not really agree with the statement completely, but only to a certain extent.

To begin, there are two different kinds of traits, which are ones that are inherited and ones that are acquired. There is no question that inherited characteristics, which are those that are passed down from one generation to the next, have an impact on our way of life. Acquired traits, on the other hand, are characteristics that we build up as we go through life. Because of this, I believe that such characteristics will have a greater impact on our thought process as well as our actions, including our responses and reactions, in comparison to the characteristics that we already possess from birth.

However, inherited features describe our personality, initially, which can be unforgettable in general. Whether or not a person's circumstances permit the growth of particular traits within their personality is an essential factor in determining the extent to which those traits can be developed. It would appear that the events that occur throughout our lives are highly variable and influential, to the point where they can either supplement or supplant the effects of other factors, and there are probably a lot of research findings that can back this up.

In conclusion, there is a meaning to the existence of characteristics within the birth. However, I firmly believe that our lifestyle is more influenced by the traits we acquire than by those we inherit.

Research indicates that the characteristics we are born - Band 7.5 IELTS model essay

Numerous studies contend that our personality as an individual is directly impacted greater by traits that are given to us at birth than by the lessons we acquire throughout our lives. The finest learnings, in my perception, are derived from experience, which also aids in the growth of our personalities.

There is no doubt that a child's features will play a significant role in defining him at a young age; however, given that change is inevitable, those features will eventually disappear. It's possible for people to be polite in the crowd but disrespectful toward the poor when they're in the company of less significant others, for instance.

It will be quite acceptable to state that we tend to be what we encounter on our voyage because time is the best mentor of all periods and teaches us all at the appropriate times. Numerous studies have also asserted that you become what you observe because our environment has a significant impact on our development and can either make or break us. Additionally, certain occasions often prompt us to reflect on and understand aspects of our societal and cultural tasks, including how to lead a happy life. Individuals learn from experience, and all of us do this in the same way. If you pay attention, a poor choice will teach you a lesson. Our life experiences will also directly influence our psychological well-being and disposition.

In conclusion, it is evident that learning the most important lessons for development comes from analysis and awareness of life. If we pay attention, everywhere around us will have an effect on us. Furthermore, I wholeheartedly concur that all of this promotes our development as people in society.

Research indicates that the characteristics we are born - Band 7 IELTS model essay

According to studies, our personalities are shaped more by our genetic makeup than by our life experiences. Research, in my opinion, reveals the truth about the significance of inherited genes and describes the major consequences of these traits in our daily lives.

To begin, I think it's safe to say that a child's fate is already set in stone, as I think that a child's emotional traits are not too dissimilar from those of their mother or father. Additionally, these traits have shaped who we are and influence how we choose to live. If a person is more pragmatic in their outlook on life, for instance, he or will not feel guilty about leaving his school for a better one, even if he has grown emotionally attached to his or her students. It could be difficult for an emotionally sensitive child to make that leap.

Second, I believe that sensory perceptions are crucial to our growth and one of the most formative aspects of our perspective on the world. The unfortunate truth is that our defining traits are inextricably linked to these changes. To put it another way, the unique qualities each of us possesses determine the nature of our individual experiences.

In conclusion, I have faith in the veracity of the research, and I also think that our genes that is, our individual properties greatly influence the choices we make, which in turn has knock-on effects on our communities and the wider world. It's important that we recognize our unique qualities and identities. If we do that, we'll have better self-control and be able to make more reasoned choices.

Research indicates that the characteristics we are born - Band 6.5 IELTS model essay

The influence that characteristics have on a person's development is currently a trending topic. It's possible that our community has some innate characteristics that play a role in the development of our personalities and how we grow. Some people believe that natural abilities make it difficult to communicate with others and make new friends. This essay looks at both sides of the argument, but I will explain why I lean more toward the former.

To begin, our innate characteristics have a significant impact on the way we behave. The first advantage of having genius is that it makes the lives of those around you easier. Second, compared to average people, gifted people are able to set specific goals for themselves because they are aware of the actions that they should take. Average people, on the other hand, need to put in their best effort in order to achieve their goals. Last but not least, characteristics propel people toward success and the admiration of others around the world.

On the other hand, some people believe that talented people are more likely to be isolated from others, which results in them having fewer friends and finding it more difficult to communicate with one another. Those are, however, exceptional circumstances; the vast majority of the time, individuals who possess natural qualities are aware of the way in which they wish to travel.

In conclusion, if we are born with a special talent, our life will be filled with more success and less difficulty than it would be if we had to work hard to acquire those experiences.
