

While some people consider global warming to be the most pressing environmental problem that we have at the moment, others believe that deforestation has a more devastating impact on our world. Discuss both and give your opinions.

Give reasons for your answer and include any relevant examples from your own knowledge or experience.

You should write at least 250 words.

While some people consider global warming - Band 8 IELTS model essay

At least for the time being, the earth is the sole home for our species, and two cataclysmic occurrences are killing the globe. Some people feel that the overexploitation of forests has had a greater influence on our planet than those who believe that global warming is the most pressing issue we must address right now. In my opinion, it is vital to explore the inherent details on all sides and reach a reasonable decision.

To start with, others believe deforestation can cause more severe environmental damage. In the beginning, fauna and flora may lose a vast array of habitats due to the escalation of human activities, which may degrade the condition of nature and ultimately limit biodiversity. Another intrinsic reason is that felling trees may impact air quality. Forests are sometimes referred to as the lungs of the planet due to their ability to absorb greenhouse gases, such as the capacity to consume carbon dioxide and generate oxygen for our environment.

On the other hand, deforestation has several downsides. As stated previously, it will increase pollution since carbon dioxide emissions will be decreased. This will also reduce the likelihood of rain. In addition, the decline in outdoor and indoor air quality severely impacts human health, particularly the respiratory and cardiovascular systems. Additionally, deforestation damages animals and causes a social imbalance.

In conclusion, these issues have devastating consequences and are interconnected. Deforestation is one of the most important underlying causes of global warming. The government should impose some limits in order to maintain forests.

While some people consider global warming - Band 7.5 IELTS model essay

The rising level of pollution has become a catastrophic problem. There are several contributing aspects to this condition. Moreover, these elements not only generate pollution but also create other problems. Although some individuals feel that global warming has the most harmful effects, others argue that deforestation is the greatest problem. This article will examine both perspectives and then examine my own perspective in succession.

To start with, global warming is the most devastating problem for a variety of reasons. Initially, it produces climatic change, such as a pronounced rise or fall in temperature. This mutation impacts both crops and animals. Importing ruined crops is necessary to meet the demands of the human population. Thus, the government faces a double loss of money spent on agriculture. and import costs. Nonetheless, whether variance also affects tree development, resulting in an increase in pollution since fewer trees consume less carbon dioxide, is yet to be determined.

On the other hand, the loss of trees and other vegetation is claimed to cause greater difficulties. The first reason is that animals unable to discover and adapt to new habitats would eventually starve to death. They may thus be on the edge of extinction in the foreseeable future. For instance, when it rains severely, there is a high likelihood of floods and soil erosion since there are no trees to absorb and retain the water. Hence, it is exceedingly unsafe for people to live near deforested slopes and mountains.

In conclusion, it is evident that both concerns are responsible for the devastating outcomes. Therefore, we must act immediately to simultaneously fight deforestation and global warming.

While some people consider global warming - Band 7 IELTS model essay

People believe that global warming is having a negative impact on the environment, while others say that deforestation has a greater impact. I would say that both concerns are crucial and require quick attention.

First and foremost, the temperature is rising due to the greenhouse effect, which is caused by the production of greenhouse gases such as carbon dioxide. As a result, it affects the climate and the habitats of humans and other species. For instance, some researchers demonstrate that as temperatures fluctuate, ice is melting globally, causing polar bears to walk or swim large distances to reach the remaining ice and wait for seals. In addition, as a result of climate, change, precipitation has increased globally on average, causing flooding in certain parts, while others are facing severe drought.

Secondly, a rapid increase in the population has resulted in the destruction of forests as the number of people in many countries continues to increase. Similarly, deforestation is at an all-time

high in these regions as a result of the need for more space in numerous populous towns. Consequently, the deforestation campaign is in full gear. Deforestation has caused several difficulties, including environmental damage, smog, and heat waves.

In conclusion, after reviewing the perspectives of both proponents, I believe that both issues are significant. But, to prioritize to avoid horrendous circumstances ahead. As one of the primary causes of global warming, I believe that deforestation should be addressed first. Consequently, if societies can eliminate the threat of deforestation, then environmental problems can be managed amicably.

While some people consider global warming - Band 6.5 IELTS model essay

Well, there is also an abundant school of thought. Many people believe that global warming is one of the greatest threats to climate change in the modern era, whereas a minority of people believe that deforestation has severe global consequences. Nonetheless, I believe that the second alternative makes more sense than the first.

First and foremost, we must recognize that the rate of deforestation greatly exceeds the rate of forest creation. The world's largest rainforest, the Amazon, which spans nine countries in South America, is being deforested at an alarming rate to satisfy the global demand for land, which many manufacturers require to establish factories. Due to this, many animal and plant species, as well as indigenous people, are being displaced from their native habitats. According to estimates, the Amazon is responsible for 20% of the world's oxygen production; therefore, the destruction of these forests will have nothing but negative effects.

In addition, the combustion of fossil fuels by factories, vehicles, and forest fires raises the earth's temperature, resulting in severe global climate change. This is evidenced by the current flooding in both India and China. In India's rural areas, the burning of crops at the end of the harvest period creates a cloud of smog that engulfs Delhi and is responsible for a large number of respiratory-related deaths.

To conclude, both global warming and deforestation pose grave threats to the continued existence of Mother Earth. A mature tree will absorb more than 48 pounds of carbon dioxide from the atmosphere and release oxygen in an exchange over the course of one year. This clearly demonstrates how interconnected deforestation and global warming are.
